This option should have the maximum access restriction of all the options of the application, only the most trusted authorized personnel should access it, since it regulates the access permissions of all the user keys to the different menus of the application. In total, a maximum of eight access keys are available to be distributed among different user categories. The lower the number, the higher the access level. Thus, for example, key 1 is the maximum, but its use is reserved exclusively for the owner, accessing successful operations that can only be accessed through this key. Key 2 is the highest level of normal use, given that both this key and key 1 have no access clippings. It is from key 3 that we can define which menus and options can be accessed.

Users.
In each user we create we will assign the corresponding role. Users can only be created by the system administrator

Granulation.
Within each "Role" we can restrict/open certain options
